# Functional derivativies of carboxylic acids

Closely related to carboxylic acids and to each other are a number of chemical families known as fucntional derivatives of carboxylic acids: Acid halide, anhydride, amide and esters. These derivatives are compounds in which the OH of the carboxylic acid has been replaced by X(Cl, Br, I), OOCR, NH<sub>2</sub> or OR.

The all contain the group

$$R-C$$

#### 1. Esters

They have a general formula

$$R-C$$
 $OR'$ 

**Examples** 

HCO<sub>2</sub>CH<sub>3</sub> Methylmethanoate CH<sub>3</sub>COOCH<sub>2</sub>CH<sub>3</sub> Ethylethanoate CH<sub>3</sub>CH<sub>2</sub>COOCH<sub>2</sub>CH<sub>3</sub> Ethylpropanoate

#### Physical properties

- (i) Insoluble in water but soluble in organic solvent
- (ii) They are neutral liquids with pleasant smell
- (iii) They have low boiling points compared to carboxylic acids of comparable molecular mass.

## Preparation

(a) By reacting carboxylic acids with alcohol in the presence of mineral acids

The Science Foundation College is the best Secondary School that teaches Sciences in Uganda Join Now: 0776 802709

RCOOH +R'OH 
$$\xrightarrow{H^+}$$
 R  $-C$  OR

Example

$$CH_3COOH + CH_3OH \xrightarrow{H^+} CH_3 - C$$

OCH

Methylethanoate

Mechanism

CH<sub>3</sub>—C
OH

$$CH_3$$
—C
 $CH_3$ —C

(b) reaction of alcohols with acid halides

$$R \longrightarrow C$$
 + R'OH  $\longrightarrow$  R — C OR' where X = Cl, Br, or I Example  $CH_3COCl + CH_3OH \longrightarrow CH_3 \longrightarrow C$  OCH<sub>3</sub> Methylethanoate

The Science Foundation College is the best Secondary School that teaches Sciences in Uganda Join Now: 0776 802709

$$CH_{3} \longrightarrow CH_{3} \longrightarrow C$$

(c) By reacting silver salts of carboxylic acid with alkyl halide

$$R - C + R'X \longrightarrow R - C O$$

$$O^{-}Ag^{+}$$

$$OR$$

#### Chemical properties

Hydrolysis
 Esters are hydrolyzed by mineral acids or alkalis

Example

$$CH_3$$
—  $C$ 
 $H^+ \text{ or } \overline{}^-OH$ 
 $CH_3COC1 + CH_3OH$ 

Mechanism (acid catalyzed)

$$CH_{3} - C - OCH_{3}$$

#### (ii) base catalyzed

$$CH_{3} \xrightarrow{C} CH_{3}O^{-} \xrightarrow{H_{2}O} CH_{3}OH + OH^{-}$$

$$CH_{3} \xrightarrow{C} CH_{3}COOH \xrightarrow{OH^{-}} CH_{3}COO^{-} + HOH$$

$$CH_{3}COOH \xrightarrow{OH^{-}} CH_{3}COO^{-} + HOH$$

Esters are reduced by LiAlH<sub>4</sub> to alcohols Examples

$$CH_3$$
  $CH_3$   $CH_3$   $CH_2CH_2OH + CH_3OH$   $CH_3$   $CH_3$   $CH_2CH_2OH + CH_3OH$ 

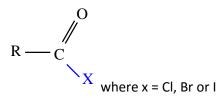

3. Esters react with amides to form acid amide

Uses of esters

In formation of perfumes

#### Acid halides

These have a general formula

## Examples

C<sub>6</sub>H<sub>5</sub>COCl Benzoylchloride

CH₃COBr Ethanoylbromide

CH<sub>3</sub>CH<sub>2</sub>COI Propanoyliodide

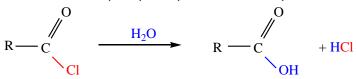

#### Preparation

By reacting carboxylic acid with phosphorus halide or thionylchloride

#### Examples

## **Chemical properties**

1. Acid halides are hydrolyzed by water to carboxylic acids

## Example

$$CH_3$$
— $C$ 
 $CI$ 
 $H_2O$ 
 $CH_3$ — $C$ 
 $OH$ 
 $+HC$ 

$$CH_{3} \xrightarrow{C} C$$

$$CH_{3} \xrightarrow{C} C$$

$$CH_{3} \xrightarrow{C} C$$

$$+ OH_{2}$$

$$CH_{3} \xrightarrow{C} C$$

$$+ OH_{2}$$

$$CH_{3} \xrightarrow{C} C$$

$$+ OH_{2}$$

$$CH_{3} \xrightarrow{C} C$$

When ethanoyl chloride is exposed to moist air white fumes are seen due to the production of HCl.

2. Acid halides react with ammonia and amines to produce amides Example

$$CH_3$$
  $CH_3$   $CH_3$   $CH_3$   $CH_3$   $CH_3$   $CH_3$ 

Mechanism

$$CH_{3} \xrightarrow{C} CI \xrightarrow{CH_{3}} CH_{3} \xrightarrow{C} CI \xrightarrow{-HCI} CH_{3} \xrightarrow{C} CH_{3} \xrightarrow{C} CH_{3} \xrightarrow{-HCI} CH_{3} \xrightarrow{C} CH_{3} \xrightarrow{C} CH_{3} \xrightarrow{C} CI$$

Acid halide react with alcohols to form esters Example

$$CH_{3} - C \xrightarrow{C} CI \xrightarrow{CH_{3}OH} CH_{3} - C \xrightarrow{OCH_{3}}$$

$$CH_{3} \xrightarrow{C} C$$

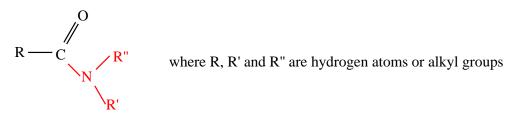

4. Acid halides react with anhydrous sodium salt of carboxylic acid to form acid anhydride Example

Mechanism

$$CH_{3} \xrightarrow{C} C$$

## Acid amide

These have a general formula

#### Examples

CH₃CONH₂ Ethanamide

CH<sub>3</sub>CH<sub>2</sub>CONH<sub>2</sub> Propanamide

## Physical properties

- They are white crystalline salts except methanamide

 Lower members are soluble in water but the solubility decreases with increasing molecular mass.

- They have relatively high boiling points due to formation of intermolecular hydrogen bonds

## Preparation

1. By reaction of ammonia with ester, acid anhydride or acid halides Examples

$$CH_3$$
  $CH_3$   $CH_3$   $CH_3$   $CH_3$   $CH_3$ 

2. Dehydration of carboxylic acids with ammonium carbonate

$$CH_3COOH + (NH_4)_2CO_3$$
  $\longrightarrow$   $CH_3CONH_2 + H_2O + CO_2$ 

## **Chemical properties**

1. They are weaker bases compared to amines and are neutral to litmus. The do not form salts with acids as amines do because their lone pair of electron on the nitrogen atom is delocalized.

$$CH_3$$
  $C$   $CH_3$   $CH_$ 

2. Amides form nitriles when distilled over phosphorus pentoxide, P<sub>4</sub>O<sub>10</sub>.

$$CH_{3} - C \xrightarrow{NH_{2}} \frac{P_{4}O_{10}}{-H_{2}O} \rightarrow CH_{3} - C = N$$

3. Amides react with hot alkaline bromine solution to give amines

$$CH_3$$
  $\longrightarrow$   $CH_3$   $\longrightarrow$ 

4. Like amines, amides react with nitrous acid liberating nitrogen

$$CH_3$$
  $\longrightarrow$   $CH_3COOH + N_2 + H_2O$ 

5. Amides are hydrolyzed with mineral acid or alkais Example

$$CH_3$$
  $\longrightarrow$   $CH_3COOH + NH_4^+$ 

$$CH_3$$
  $\longrightarrow$   $CH_3COO^- + NH_3$ 

# (a) Acid catalyzed

$$CH_{3} - C \qquad +H^{+} \longrightarrow CH_{3} - C \qquad CH_{3} - C \longrightarrow NH_{2}$$

$$CH_{3} - C \longrightarrow NH_{2}$$

$$CH_{3} - C \longrightarrow NH_{2}$$

$$CH_{3} - C \longrightarrow NH_{3}$$

$$CH_{3}$$

Thank you
